

Machine learning based prediction
of visibility selection
in a satellite communication ground network

Kyle Polich

SPACE OPERATIONS

Ground Software as a Service

- Freedom™ Software Platform
- Flex Scheduler
- Cognitive Constellation Scheduling
- Insights program

Visibility

A period of **time** when a spacecraft has visual contact with a ground station.

Task Request

A period of **time** when a customer requests use of a Visibility.

Task

A (tentative) allocation of resources for communication.

Schedule

A list of Tasks.

The Scheduling Problem

Input: Task Requests & System Data

Output: Schedule

Challenge: How to resolve conflicts?

How to minimize disappointment?

Example Schedule at one Site

Partial real world example

Scaling up Scheduling

Scheduling & De-Confliction

**When two users want the same resource at the same time,
who “wins”?**

- Simulations are run during onboarding
- Contractual obligations can exist
- Flexibility enables efficient sharing of resources
- Cognitive constellation management allows autonomous scheduling
- Predictive analytics and machine learning automation (**this talk!**)

Data Lake Strategy

Scheduling decisions are informed by a variety of data.

All the data. One place.

Motivations to link data sources

- Pro-active detection of issues
- Reduce time to resolution
- Space Weather impacts us!
 - <https://spaceweatherarchive.com/2022/02/09/the-starlink-incident/>
 - 2022 Hunga Tonga-Hunga Ha'apai eruption and tsunami
- Rare events require additional context

Data Lake Strategy

- Space weather
- Terrestrial weather
- Ground site telemetry metrics (e.g. rf power)
- Pass telemetry metrics (e.g. E_b / N_0)
- Hardware logs
- Software logs

Example Pass Metric

ETL and Feature Engineering

- Hand Engineered Features

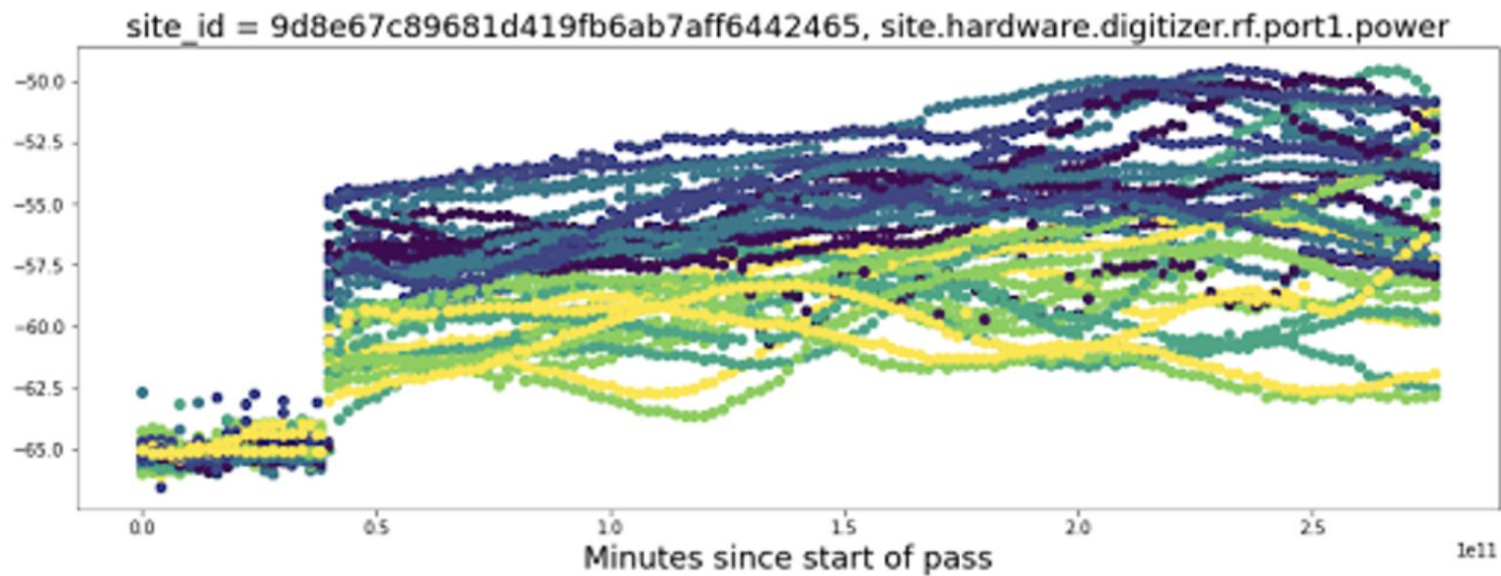

→

Eb / N0 pass becomes 9 features

- Time until start
- min/mean/stdev/max before lock (4)
- min/mean/stdev/max after lock (4)

ETL and Feature Engineering

- Hand Engineered Features
- **Historical Profiles**

ETL and Feature Engineering

- Hand Engineered Features
- Historical Profiles
- **Anomaly detection**
 - Bollinger bounds
 - Pruned Exact Linear Time (PELT)
 - Ruptures python library
 - FB prophet forecast vs. actual

ETL and Feature Engineering

- Hand Engineered Features
- Historical Profiles
- Anomaly detection
- **Frequency counters** - How often did Event X happen in period Y?
- **Summary statistics** - mean, stdev, median, skewness, kurt., percentiles
- **Windowed calculations** - e.g. rolling average

Visibility Prediction Problem

Can we predict
if a future **Task Request**
will target a particular **Visibility**?

- Scheduling requests are on-demand
- Acceptance is near real time
- Undesirable bias towards early booking customers; Bumped Tasks can occur

Full real world example

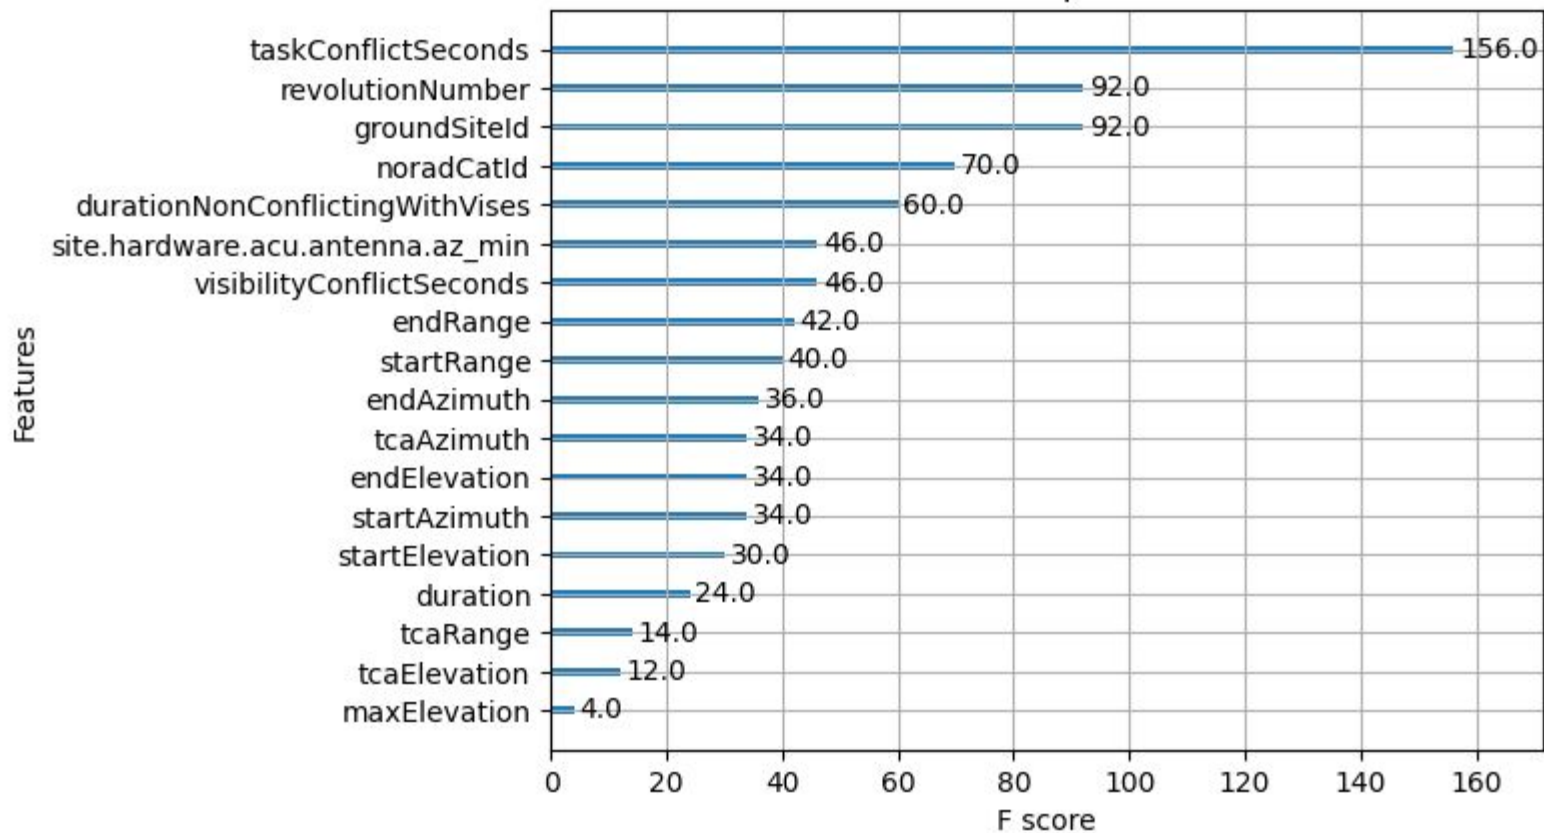

Visibility Prediction Problem

Can we predict
if a future **Task Request**
will target a particular **Visibility**?

Feature importance

Current / Future work

- Operational integrations
- Failure detection
- Automated recovery from failure
- Predictive maintenance
- Cognitive scheduling
- Anomaly detection with human feedback
- Chat GPT on JIRA tickets

Thank you!
