

# AALYRIA

CONNECTIVITY EVERYWHERE

# NETWORKS AT PLANETARY SCALE

Aalyria brings together two technologies originally developed at Google Alphabet as part of its wireless connectivity efforts: a software platform for **orchestrating** networks across land, sea, air, space and beyond and an atmospheric laser communications technology for **delivering** the highest speed data transfer across the same domains.

# COGNITIVE NETWORKING WITH TEMPOROSPATIAL SDN

Temporospatial SDN (TS-SDN) represents a new approach to networking. Unlike conventional SDN or SD-WAN technologies, which are only capable of route orchestration across the ground segment of a wired network, a TS-SDN augments the network information with a *digital twin* capable of modeling the position, orientation, and motion of physical platforms and forecasting their wireless signal propagation opportunities over time - building a holistic and predictive view of the entire accessible network topology. Leveraging predictability in motion, weather, and faster-than-realtime modeling allows TS-SDN to jointly optimize and solve the steerable beam tasking & scheduling, radio & optical transceiver resource management, and path-agnostic route orchestration across space and time in all domains.

# SPACETIME

A temporospatial SDN platform for all-domain mesh orchestration

Antenna tasking, routing, and RRM

Ground segment SDN and SD-WAN

Planet scale digital twin

ITU Article 22 and weather-aware ITU-R Propagation loss modeling (1 MHz to 100 GHz)

Delay / disruption tolerance

Atmospheric free space optics ready

Hosted on K8s with pod autoscaling

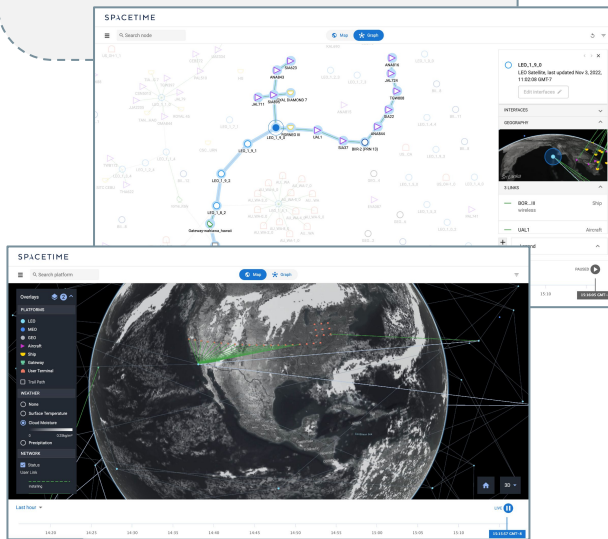

# SPACETIME

## HOW IT WORKS

### Service Requests

Create Coverage: A → {region}, or  
 Create Connection: A → G  
 - MEF E-Line, E-LAN, E-Tree, etc.  
 - 3GPP "Slice", etc.

DTN Flow? No  
 Set Priority: High  
 Data Rate: 10 → 100Mbps diurnal

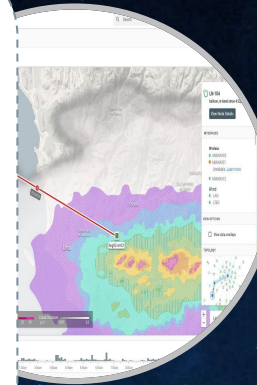

### Realtime Schedule Optimization

"Digital Twin" models:

-  Weather
-  Physical Geometry
-  Spectrum Physics
-  Tx Power to Target
-  Throughput

"Cognitive Engine" considers:

-  Real Telemetry
-  Priority
-  Other Requests
-  Keep Out Zones

### Cognitive Engine output

Task

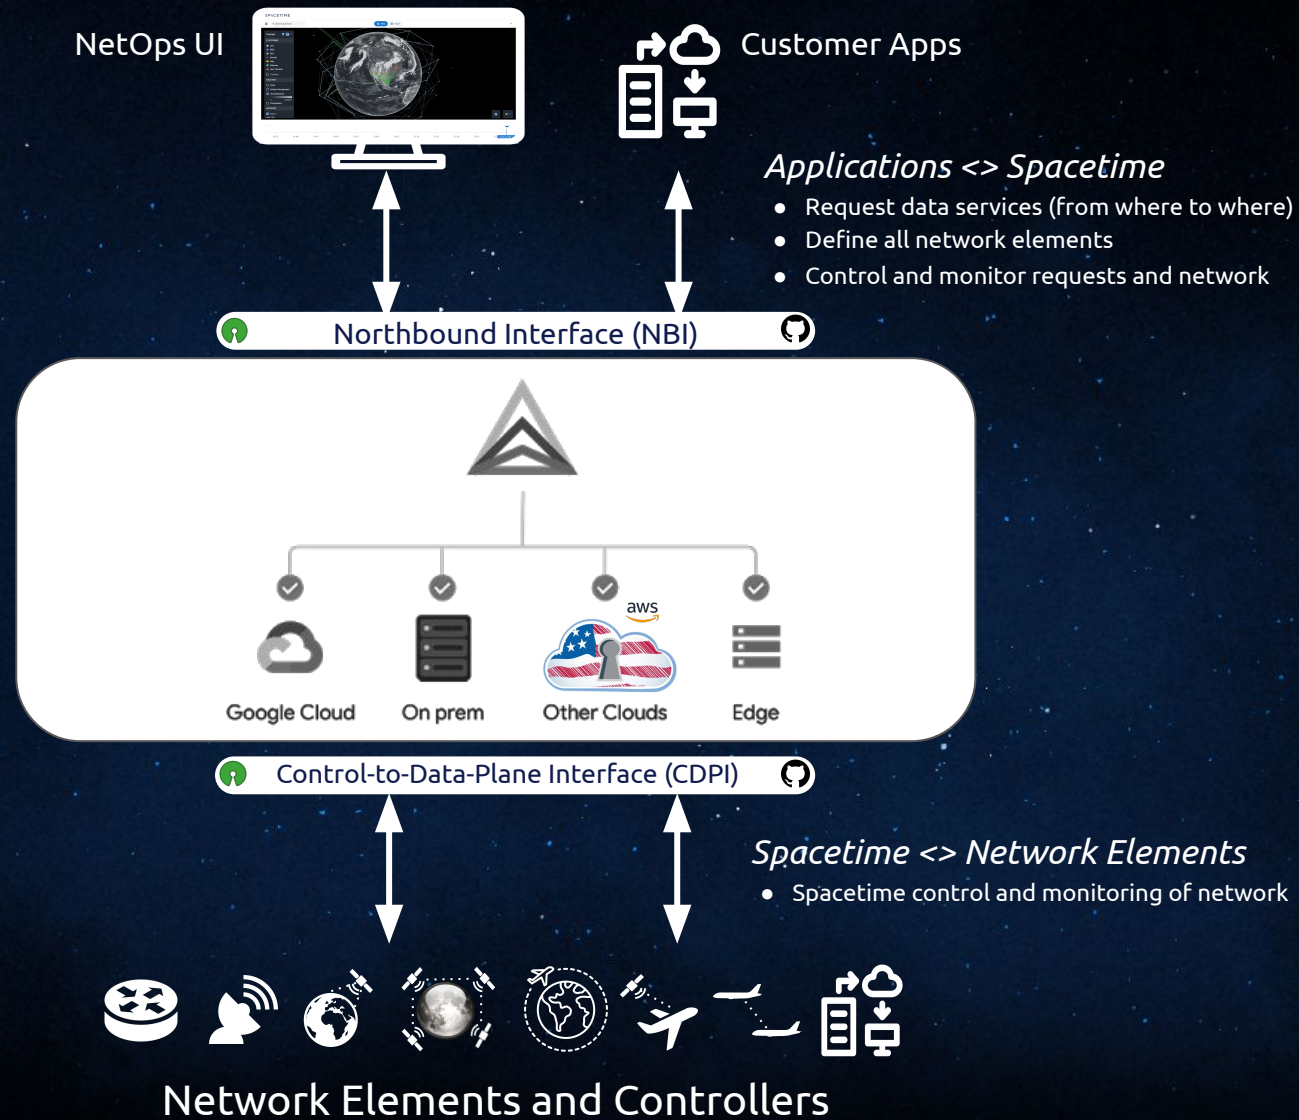

IPv4, IPv6  
 SR-MPLS, SRv6

# SPACETIME FEDERATION

- The data transfer object defining the **capabilities** of any owned resource (not just idle ones!) *may* be streamed to the **federation backend** with **ask prices** [\$ / minute] for future time intervals.
- e.g., Ground Stations, Space Relays, % idle capacity in a beam, or even the rights to use/share RF **spectrum**.
- Solving engine can optionally bid and make **temporospatial resource reservations**.
